Sequences were determined from the ends of chromosome 11-specific cosmids by automated sequencing without intermediate subcloning. A sample of 371 by automated sequencing without intermediate subcloning. A sample of 371 but sequence fragments were determined and of these, 277 were suitable cor STS primer prediction by computer analysis (using the "Primer" program available from E.Lander, MTJ. The STSs and cosmids were mapped by in situ hybridisation, somatic cell hybrid analysis or both. Using complet from were regionally mapped. This procedure illustrates a novel method for sequencing complex genomes, designated "sequence sampled mapping". The sequence sampled mapping method is useful for the completion of high density sequence-based maps, and ultimately, for the complete sequencing of genomic DNA directly from cosmid clones. See AAQ82101-082706 and AAQ91255-Q91358 for STS primers. (Updated on 25-MAR-
                                                                                                                                                                                                                                                                                  Sequencing complex genomes, present as fragments in a cosmid library - k sequencing end-specific nucleotides of each clone then correlating with spatial relationship of cosmid, esp. for mammalian chromosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to methods for generating cell lines and mammals with site-specific genetic modification. The methods use homologous recombination between an artificial chromosome having the modification and an endogenous chromosome of a cell. The resulting modified cells can be used to generate genetically modified mammals useful in screening methods to identify compounds of therapeutic interest. Cells can also be modified to eliminate a mutation associated with a disease, e.g. cancer, and then transplanted into patients for treatment of the disease. In an example of the method, bacterial artificial chromosomes (BACS) containing mutations in fancg/xrcc9 were used to modify mouse embryonic stem (ES) cells for the generation of fancy/xrcc9 knockout mice. The present primer, designated G34, was used in a nested PCR to screen modified BAC clones for correct targeting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sequence sampled mapping; genomic analysis; complex genome mapping; cosmid library; chromosome 11; sequence tagged site; STS analysis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Producing a genetically modified mammalian cell, useful in producing modified non-human mammal for screening compounds to treat or prevent cancer, by inserting into mammalian cells an artificial chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0; Gaps

                                                                                                                                                                                   The invention relates to the isolation of polymorphic repeat sequences having the sequence (dd-da)n.(dd-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones contraining the animal or plant breeding or pedigree analysis. Or or containing the phage libraries with a synthetic poly(dc-da).(dd-dT) probe. Over 100 phage libraries with a synthetic poly(dc-da).(dd-dT) probe. Over 100 repeat blocks were isolated. The primers AAT65798-T66047 were used to PCR sequences. The primers AAT65797-7 were used to emplify the inserts from the isolated clones containing the repeat sequence marker clone Mfd90. (Updated on 25-MAR-2003 to correct PF
Detection of polymorphic genetic markers of the form (dC-dA)\,n\,(dG-dT)\,n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a G-protein coupled receptor polypeptide (GPCR), termed TGR, and its associated nucleic acid. The sequences of the invention are useful for identifying a compound that modulates signal transduction and for identifying a mammal having a TGR-associated disorder. The proteins and nucleic acids are useful in diagnosis and treatment of diseases or conditions such as renal failure, nephritis, hypothyroidism, hypogonadism, retinitis pigmentosa, growth disorders, diabetes insipidus, hyperprolactinaemia and disturbances of thirst, sleep, temperature regulation, appetite, blood pressure or any other syndrome or disease associated with the hypothalamus. The sequences can be used in regulation of circadian rhythms, for use as genetic markers for the identification of mutations associated with diseases resulting from GPCR inactivation in particular cell types and for identification of mutations associated with diseases resulting from GPCR inactivation in particular cell types and for identification of mutations. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated G-protein couple receptor polypeptide, termed TGR, for diagnosis and treatment of diseases such as renal failure, nephritis, hypothyroidism, diabetes insipidus, and disturbances of thirst and sleep.
TGR-associated disorder; signal transduction; renal failure; nephritis; hypothyroidism; hypogonadism; retinitis pigmentosa; growth disorder; diabetes insipidus; hyperprolactinaemia; thirst disturbance; appetite; sleep disturbance; temperature regulation; blood pressure; hypothalamus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .;

This is a neurological disorder with a genetic basis (DYXCI has been isolated to chromosome 15q21), which manifests itself as a specific reading disability. Specifically, DYXCI is can be useful in study of brain processes such as reading, phonological processing, rapid naming and verbal short-term ementy. Accordingly, the present invention describes methods and materials for analysing allelic variations in the DYXCI gene, and also provides DYXCI as an antigen for the production of antibodies used in the diagnosis of dyslexia. This oligonucleotide is the EXNI-IR PCR primer that is specific for human intronic DYXCI, and is used to amplify exon 1 in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Osteopathic; Anorectic; Antidiabetic; Cytostatic; Antiinflammatory; Immunomodulatory; Anabolic; Endocrine; Antianemic; Antiangiogenic; Leptin receptor related protein; OB-RGRP; leptin receptor; leptin-related disorders; osteoporossis; calcification; obssity; diabetes; anorexia; sexual maturity disorder; haematopolesis; angiogenesis; thrombus formation; immunity; inflammation; fetal development; cancer;

The present invention relates to a leptin receptor related protein (OB-RGRP) antisense oligonucleotide (ON; ADR27653), that hybridises CG RGRP) antisense oligonucleotide (ON; ADR27653), that hybridises preditically with and inhibits the expression of ADR27652. The ON promotes expression of leptin receptors on the cell surface and may contain phosphorothioate bonds; 2'-on-methyl nucleotides and/or a contain phosphorothioate bonds; 2'-on-methyl nucleotides and/or a criatethyleneglycol residue at the 3'-end. Also claimed are interfering RNA triatethyleneglycol residue at the 3'-end. Also claimed are interfering RNA (IRNA) of 15-25 nt that hybridize specifically with ADR27672, and inhibit contains sequences comprising OB-RGRP or MY047 (thought to be a member of coding sequences comprising OB-RGRP or MY047 (thought to be a member of the OB-RGRP family, shares 68% homology with OB-RGRP, and a protein that the observation of energy e.g. luciferase or yellow fluorescent or protein (YPP) for detecting compounds that modify the interaction between continuous for protein (YPP) for detecting compounds that modify the interaction between containing the leptin related disorders. ON, also related interfering RNA, are created for prevention and/or treatment of leptin-related disorders, costeoporosis (or other conditions involving reduced bone density); calcification, obseity; diabetes, anorexia; disorders of sexual maturity, and inflammation, fetal development and cancer. The present sequence is a content of illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         tumour suppression; tumour reversion; apoptosis; virus resistance; cytostatic; virucide; neuroprotective; nootropic; neuroleptic; probe; primer; PCR; gene chip; antisense; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; ds; human.
                                                                                                                                                                                             New oligonucleotides that inhibit expression of the leptin receptor related protein, useful for treatment and prevention of e.g. osteoporosis, obesity, diabetes, anorexia, hematopoiesis, and

in the phenomena of tumour suppression, tumour reversion, apoptosis in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, correctly primers for detecting, indentifying, quantifying and/or probes and primers for detecting, indentifying, quantifying and/or correctly for example as one component of a gene chip, in amplifying nucleic acid, for example as one component of a gene chip, in viru as antisense reagents and for production of recombinant correctly preparation of colypeptides. The invention may therefore be useful for preparation of opypeptides. The invention and/or treatment of viral diseases that correctly concern but also Alzheimer's disease and schizophrenia. The specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence data for this patent did not form part of the printed Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO content to the printed of the printed of the printed of the printed of the form part of the printed of the fire wipo.int/pub/publishedpct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, mouse, SACI, carbohydrate, sweetener; ethanol; alcoholism; s8;

The invention relates to an isolated polypeptide, comprising a variant form of mouse or human SACI polypeptide. The variant form is associated with altered preference for carbohydrates, other sweeteners or ethanol.

The polypeptide and its associated DNA sequence can be produced by crecombinant techniques and is useful for preventing obesity, diabetes or alcoholism associated with SACI expression. The sequences are useful in screening for drugs and sweeteners. Recombinant cell lines and transgenic cor repress function of SACI. Predisposition to diabetes, obesity or alcoholism can be ascertained by testing any fluid or tissue of a human can be ascertained by testing any fluid or tissue of a human can be ascertained by testing any fluid or tissue of a human can be ascertained by testing any fluid or tissue of a human can be ascertained by testing any fluid or tissue of a human can be ascertained by the SACI locus may indicate a predisposition to diabetes, obesity and/or alcoholism and may provide a diagnostic mark. The polynucleotide can be detected in a biological sample by contacting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and conservation of the SACI pens specific for the SCAI genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                 Novel isolated polypeptide comprising variant form of mouse or human SACI polypeptide, and is associated with altered preference for carbohydrates or other sweeteners, useful for preventing obesity, diabetes, alcoholism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; mouse; SAC1; carbohydrate; sweetener; ethanol; alcoholism; ss;

```
The invention relates to an isolated polypeptide, comprising a variant form of mouse or human SAC1 polypeptide. The variant form is associated with altered preference for carbohydrates, other sweeteners or ethanol. The polypeptide and its associated DNA sequence can be produced by recombinant techniques and is useful for preventing obesity, diabetes or alcoholism associated with SAC1 expression. The sequences are useful in screening for drugs and sweeteners. Recombinant cell lines and transgenic embryos may be used in screening for and identifying agents that induce or repress function of SAC1. Predisposition to diabetes, obesity or alcoholism can be ascertained by testing any fluid or tissue of a human (such as blood, pancreas or tongue) for sequence variations of the SAC1 ocus may indicate a predisposition to diabetes, obesity and/or alcoholism and may provide a diagnostic mark. The polymucleotide can be detected in a biological sample by contacting the DNA with a probe to form a hybridisation complex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
Novel isolated polypeptide comprising variant form of mouse or human SAC1 polypeptide, and is associated with altered preference for carbohydrates or other sweeteners, useful for preventing obesity, diabetes, alcoholism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cDNA encoding human and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antirheumatic; antiarthritic; antibacterial; antiaeborrheic; dermachogical; antipaoriatic; neuroprotective; noctropic; antiparkinsonian; antidabetic; ophthalmological; antiasthmatic; antidepressant; neuroleptic; hypotensive; tranquilizer; hypertensive; anotectic; metabolic; virucide; osteopathic; antiaspinal; vulnerary; gene therapy; G-protein coupled receptor protein; HGPRBAK30; immune disorder; cardiovascular disorder; inflammatory disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                          The invention relates to an isolated human G-protein coupled receptor, CC HGPBMY30 polypeptide or a sequence having 95% identity to the above HGPBMY30 polypeptide or a sequence having 95% identity to the above condition, selected from an immune disorder; a cardiovascular disorder; an inflammatory disorder in which G-protein coupled receptors are either disorder; a reproductive disorder; a metabolic disorder; a metabolic disorder; a metabolic disorder; a neural disorder; an endocrine disorder; castionteetinal disorder; and (II) are also useful for detecting, proprietic and pulmonary disorders. Alzheimer's, Parkinson's alseases, diabetes, dwarfism, color blindness, retinal pigmentosa, astima, expression, schizophrenia, sleeplessnesses, hypertension, anxiety, stress, renal failure, acute heart failure, hypotension, obesity, anorexia, HIV infections, osteoporosis, angina pectoris, and myocardial infarction. (I) and (II) are useful for modifying the activities of (I).

C food additive or preservative, and for modifying the activities of (I).

C food additive or preservative, and for modifying the activities of tissue, pigmentation, size and shape, to change a mammal's mental state or physical state by influencing biorhythms, caricadia rhythms, caricadia rhythms, caricadia rhythms, caricadia rhythms, caricadia rhythms, creassion, tendency for violence, tolerance for pain, reproductive capabilities, hormonal or endocrine levels, appetite, libido, memory, creass, or other cognitive qualities. This sequence corresponds to a PCR primer for the coding sequence for the novel HGPRBMY30 protein.

The invention relates to SACI polypeptides and the polymucleotides canceling them. The polymucleotides contain a variation associated with encoding them. The polymucleotides contain a variation also sensing carbohydrates, other sweeteners or ethanol. The invention also comprising altering SACI activity in the sample and measuring the comprising altering SACI activity in the sample and measuring the activity, a method for analysing a polymucleotide in a biological sample, comprising contacting a polymucleotide in a biological sample, activity, a method for analysing a polymucleotide in a biological sample, comprising comparing to probe where the probe hybridises to a SACI polymucleotide to form a probe where the probe hybridises to a SACI polymucleotide to form a probe where the probe hybridises of the Nybridisation complex, a method of it is mucleotide sequence of the suspected SACI allele with a wild type condition sequence, and a method of treating or preventing obseity, and the wild-type sequence identifies a sequence variation of the SACI allele sequence, and a method of treating or preventing obseity, and instering to a subject a pharmaccuntical composition and a transgenic comming that carries an altered SACI allele. The methods and compositions and invention are useful for screening drugs for inhibition or consumption therapies and for identifying sweeteners and alcohols. This consumption therapies and for identifying sweeteners and alcohols. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polynucleotides for sensing carbohydrates, other sweeteners, or ethanol, useful for screening drugs for inhibition or restoration of gene function as antidiabetic, antiobesity or antialcohol consumption
                                                                                                                                                                                                                                                                           Tordoff MG;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to SACI polypeptides and the polynucleotides encoding them. The polynucleotides contain a variation associated with sensing carbohydrates, other sweeteners or ethanol. The invention also relates to a method for analysing a biomolecule in a biological sample, comprising altering SACI activity in the sample and measuring the activity, a method for analysing a polynucleotide in a biological sample, comprising contacting a polynucleotide in a biological sample, comprising contacting a polynucleotide in a biological sample, comprising contacting a polynucleotide in a biological sample, comprising comparing the hybridisation complex, a method of identifying susceptibility to obesity or diabetes comprising comparing the nucleotide sequence of the suspected SACI allele with a wild type nucleotide sequence, where the difference between the suspected allele and the wild-type sequence identifies a sequence variation of the SACI nucleotide sequence, and a method of treating or preventing obesity, administering to a subject a pharmaceutical composition and a transgenic animal that carries an altered SACI allele. The methods and compositions of the invention are useful for screening drugs for inhibition or restoration of gene function as antidiabetic, antiobesity or antialcohols. This sequence represents a PCR primer used to amplify human SACI DNA of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

The invention relates to a novel process for increasing the metabolites of carotene content of a plant. The novel process comprises upregulating at least one gene which encodes carotene hydroxylase activity. The compositions of the novel process have lycopene beta-cyclase or a beta-carotene hydroxylase activity. The process is useful for increasing the metabolites of carotene content of a plant, comprising transforming a plant cell from which viable plants may be recovered, using a plant expression cassette, or a DNA construct, and generating viable plants from the cell. The carotene metabolites are useful for increasing roamantin and beta-carotene, including oxygenated carotenoids. This polymucleotide sequence represents an RT-PCR primer used in the process for the expression of the introduced proteins and endogenous carotenoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ss; siNA; human; BCL2; short interfering nucleic acid; RNA interference; cytostatic; immunosuppressive; virucide; anti-HIV; cancer; autoimmune disease; viral infection; HIV.

     that downtion relates to a novel short interfering nucleic acid (siNh) that downregulates expression of the BCL2 gene by RNA interference. A siNA of the invention has cytostatic, immunosuppressive, virucide, and anti-HIV activity. The siNA are useful for modulation (inhibition) of expression or activity of BCL2 by RNA interference. siNA are used to modulate expression of BCL2 genes, in cells, tissue explants or organisms, e.g. for treating cancer, autoimmune diseases and viral infections (including by HIV) but also for drug screening, diagnosis, target identification and validation, genetic enginecting, pharmacogenomics, studying gene function and gene mapping (e.g. of single-nuclectide polymorphisms). The sequences shown in ADF49273-ADF50143 represent siNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel short interfering nucleic acid (siNA) that downregulates expression of the BCL2 gene by RNA interference. A siNA of the invention has cytostatic, immunosuppressive, virucide, and anti-HIV activity. The siNA are useful for modulation (inhibition) of expression or activity of BCL2 by RNA interference. siNA are used to modulate expression of BCL2 genes, in cells, tissue explants or organisms, e.g. for treating cancer, autoimmune diseases and viral infections (including by HIV) but also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (e.g. of sing runcleotide polymorphisms). The sequences shown in ADF49273-ADF50143 represent siNA of the invention.
                                                                                                                                                                         New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer or autoimmune disease, downregulates expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

                                                                                    The present sequence is a Campylobacter fetus c-gtp gene specific probe. The c-gtp gene encodes a guanosine 5'-triphosphatase (GTBase) enzyme, or GTP-binding protein. The gene can be used in the prepn. Of probes and primers, i.e. the present sequence, for the detection and differentiation of microorganisms in biological samples. Thermophilic and veterinary campylobacter sp. can be detected with probes or primers derived from the c-gtp-1 and c-gtp-2 gene families, respectively. Thermophilic campylobacter sp. include C. jejuni, C. coli, C. lari and C. upsaliensis, which are human pathogens involved in diarrhoes causing infections.
                                                                                                                                                                                                                                                       Veterinary Campylobacter sp., encompass sp. which are important in veterinary infections, e.g. C. fetus, C. hyointestinalis and C. mucosalis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method of identifying textiles of fur, comprising amplifying DNA fragment specific for each animal fur, and analysing amplified DNA. The method is useful for identifying fur textiles. The method effectively distinguishes the origin of animal fur. The present sequence represents a fox specific PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying fur textiles involves amplifying DNA fragment specific for each animal fur, and analyzing amplified DNA.
                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relates to an antisense oligonucleotide comprising 8-80 nucleobases in length targeted to the coding region of a nucleic acid molecule encoding PPAR-delta (peroxisome proliferative activated receptor delta), where the antisense compound inhibits the expression of the PPAR-delta delta and has any of the 66 sequences of 20 amino acids fully defined in the specification. Also included are a compound of 8-80 nucleobases in length that specifically hybridises with at least an 8-nucleobase portion of a preferred target region on a nucleic acid molecule encoding PPAR-delta and a composition comprising the antisense oligonucleotide and a carrier. The antisense oligonucleotide comprises at least one modified internucleoside linkage (preferably a phosphorothioate linkage), at least one sugar molety (preferably 2'-O-methoxyethyl molety) and at least one modified nucleobase (which is a 5-methyl cytosins). The antisense compounds are useful for treating cancer, osteoporosis, diabetes or various endocrine disorders. The Human PPAR delta gene is located on chromosome 6p21. The present sequence is an antisense oligonucleotide of the invention targeting human PPAR delta.
                                                                                                                                                                                                                                                                                                               /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an antisense oligomucleotide comprising 8-80 mucleobases in length targeted to the coding region of a nucleic acid mucleobases in length targeted to the coding region of a nucleic acid delta, where the antisense compound inhibits the expression of the PPAR-delta delta and has any of the 66 sequences of 20 amino acids fully defined in the specification. Also included are a compound of 8-80 nucleobases in length that specifically hybridises with at least an 8-nucleobase portion of a preferred target region on a nucleic acid molecule encoding PPAR-colfa and a composition comprising the antisense oligonucleotide and a carrier. The antisense oligonucleotide comprises at least one modified on sugar moiety (preferably a phosphorothioate linkage), at least one sugar moiety (preferably 2.0-methoxyethyl moiety) and at least one compounds are useful for treating cancer, osteoporosis, diabetes or compounds are useful for treating cancer, osteoporosis, diabetes or various endocrine disorders. The Human PPAR delta gene is located on chromosome 6p21. The present sequence is a human PPAR delta cDNA target consequence for the antisense oligonucleotides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The present invention relates to an oligonucleotide anti-sense to e.g., cinitiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-cinitiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-complexity of 11.0-4 receptor. IL-5 receptor or salts of the coligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a ceptional partiactory or lung disease, which involves administering to the alrways of subject an effective amount of an inhibitor. The oligonucleotide is of a subject an effective amount of a medicament for the prevention and/or treatment constructory or lung disease. The respiratory or lung disease. The respiratory or lung disease. The respiratory or lung disease. Consention alrway inflammation, allergy(ies), asthma, impeded chosen from alrway inflammation, allergy(ies), asthma, impeded constructive pulmonary diseases syndrome (CODP), allergic rhinitis (AR), acutte respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway construction. The present sequence represents an oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                         Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codons and introns of respiratory disease-relevant genes e.g., CCRI, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g., asthma.

                                                                    Antilipaemic, Cardiovascular, Analgesic, Antianginal, Antisense therapy, Human, Endothelial Lipase, dyslipidaemia, high density lipoprotein, HDL, cardiovascular disorder, metabolic syndrome X; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                                                                                          /*tag= a //*tag= a //*tag= a //*tag= A //*tag= //*mod_base= OTHER //*mod_base= "This Oligonucleotide has a phosphorothioate backbone and 2-'methyoxyethyl (2'-MOE) wings at the 5' and 3' ends, which are 4 nucleotides in length. Also all cytidine residues are 5-methylcytidines"
Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; HDL; cardiovascular disorder; metabolic syndrome X; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25511), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

This invention describes novel antisense oligonucleotides targeted to a nucleic acid encoding PPAR-delta, which specifically hybridise to and inhibit expression of PPAR-delta. The oligonucleotide specifically hybridises with at least an 8-nucleobase portion of an active site on the mucleic acid molecule encoding the PPAR-delta and comprises at least one modified internucleoside linkage, which is a phosphorothicate linkage, at least one modified sugar moiety, which is a 2'-O-methoxyethyl sugar moiety or at least one modified nucleobase, which is a 5-methylcytosine. The antisense oligonucleotides are useful for preparing a composition for treating hyperproliferative disorders, e.g., cancer. The oligonucleotides of the invention have cytostatic activity and can be used for gene
                                                                                                                                                                                                                                New antisense oligonucleotide, having a sequence targeted to a nucleic acid encoding PPAR-delta, useful for preparing a composition for treating hyperproliferative disorder, e.g., cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antisense; PPAR-delta; human; hybridisation; inhibitor;

This invention describes novel antisense oligonucleotides targeted to a nucleic acid encoding PPAR-delta, which specifically hybridise to and inhibit expression of PPAR-delta. The oligonucleotide specifically hybridises with at least an 8-nucleobase portion of an active site on the nucleic acid molecule encoding the PPAR-delta and comprises at least one modified internucleoside linkage, which is a phosphorothhoate linkage, at least one modified sugar moiety, which is a 2'-O-methoxyethyl sugar moiety of an at least one dedified nucleobase, which is a 5-methylcytosine. The antisense oligonucleotides are useful for preparing a composition for treating hyperproliferative disorders, e.g., cancer. The oligonucleotides of the invention have cytostatic activity and can be used for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 mucleotides of the 5'-end or 3'-end of a mucleotides of the forest of a method of screening a candidate compound that binds to one or more nucleic acid target (8) or expressed product (8), for the prevention and/or treatment of a respiratory or lung disease. The coligonucleotides are useful for reducing or inhibiting expression of a constant of a post a. PDE4 & post B. PDE4 & post B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                          Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Arthritic condition; CD21L; lymphotoxin-beta; chemoattractant; arthritis;

                                                                                                                                                                                                                                      arthritic condition in a mammal. The method comprises determining whether or not a sample from the mammal contains at least 1 marker (e.g. an elevated level of a LD21L polypeptide, an elevated level of a lymphotoxin-beta polypeptide, or an elevated level of a chemoattractant polypeptide). The presence of the marker indicates that the arthritis condition is severe. The method is useful for diagnosing the severity of an arthritis condition (e.g. rheumacoid arthritis) in a mammal, particularly a human. Control PCR primers ABU76832-33 were used to amplify a beta-actin cDNA fragment from a synovial tissue sample. The primers were used in the method of the invention
                                                                                                 Determining the severity of arthritic conditions, e.g. rheumatoid arthritis, in a mammal or human by detecting whether a sample contains elevated levels of marker(8), e.g. CD21L polypeptides or lymphotoxin-beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rheumatoid arthritis condition, RA; cytokine; interleukin-1 beta; IL-1beta; interleukin-4; IL-4; interleukin-10; IL-10; interferon-gamma; IFN-gamma; tumour necrosis factor-alpa; TNF-alpha; transforming growth factor-beta; TGF-beta; diffuse; follicular; granulomatous; human; beta-actin; PCR; primer; ss.
                                                                                                                                                                                                                           specification describes a method for determining the severity of

The present invention relates to novel methods for constructing fungal strains useful for identification and validation of gene products as targets for therapeutic agents, for creating a collection of identified essential genes, and screening assays for the discovery of new drugs. The invention provides the GRACE (gene replacement and conditional expression) method for the construction of mutant organisms referred to as GRACE strains of the organism. The invention can be applied to any Aspergillus fumigatus and Cryptococcus neoformans. The methods are useful to identify agents that may be used in the treatment of fungal infections. AAS23687-AAS23747 represent primers A #1-61 used as probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                            The present invention relates to a method for evaluating rheumatoid arthritis (RA) condition in a patient. The method involves determining the level of cytokines (e.g. interleukin-1 (IL-1) beta, interleukin-4 (IL-4), interleukin-4 (IL-4), interleukin-4 (IL-4), interleukin-4 (IL-4), interleukin-10 (IL-10), interferon gamma, tumour necrosis factor-4), interleukin-10 (IL-10), interferon gamma, tumour necrosis factor-4 lapha (TMR-alpha), and transforming growth factor-beta (TGF-beta)) within the sample from a patient, comparing the level to reference levels to condition as batient bout the RA condition, and classifying the RA condition based on information. The method is useful for classifying a RA condition based on information. The method is useful for classifying a RA condition as diffuse, follicular, or granulomatous, and for determining if an individual suffering from a RA condition will develop severe disease. The present sequence represents a PCR primer used in the examples of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   essential gene; GRACE; pathogenic fungus; conditional expression; fungal infection; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Primer A #15 used as probe for identifying C. albicans GRACE strain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying genes essential to fungal metabolisms and identifying potential therapeutic agents that target these genes.

The invention relates to constructing (MI) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by the expression of the second allele is regulated by the promoter. Go that expression of the second allele is regulated by the promoter. (MI) is useful for constructing a strain of diploid fungal promoter. (MI) is useful for pathogenicity of a fungus, a gene that cells having both alleles modified are useful for identifying a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian capen. (MI) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon activity of a gene product, preferably enzymatic activity, carbon activity of a useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon cativity of a gene product, preferably enzymatic activity, carbon activity of a seful for identifying a compound having the activity to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of a primer used in the method of the invention. Note: The sequence data for

This invention describes a novel method for the detection and/or typing of Helicobacter pylori strains present in a sample using PCR primers and probes to detect regions of the vacuolating toxin (vacad) gene and other virulence determinant genes (VDG) e.g. the cytotoxin-associated (cagh) gene. The method allows the typing and allele-specific detection of a strain according to the VDG alleles present in that particular H. pylori strain. The virulence determinant genes are the genetic elements involved in enabling, determining, and marking the infectivity and/or pathogenicity of the H. pylori strain. The method provides a way of detecting H. pylori strains in a sample with respect to the development of chronic active gastritis, gastric and duodenal ulcers, gastric adencarcinomas, mucosa-associated lymphoid tissue lymphomas, and/or determining eradication therapy. AAV73508-V73546 represent PCR primers and probes used in the detection of the H. pylori vacA and cagA genes. The primers and probes are used especially to detect the vacA S regions Slabb/c and S2 and the M regions MI and M2 which are represented in
                                                                                                                                   ö
this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office

(first entry)

```
Preparing a DNA molecule comprises attaching an adaptor having at least one known sequence and a nonblocked 3' end to the ends of the modified DNA fragments to produce adaptor-linked fragments.
                                            DNA molecule preparation method oligonucleotide primer #95.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to 566 new isolated human polypeptides and their encoding genes, sequences that are at least 95% identical to these or sequences comprising one or more conservative substitutions in these. The polypeptide, polymelectide and antibodies against the polypeptides are useful in diagnosing, treating or preventing NOYX-associated disorders, e.g. cardiomyopathy, atherosclerosis, hypertension, cancer, obesity, Alzheimer's disease, Rultiple sclerosis, graft-versus-host disease, hand, multiple sclerosis, asthma, or fertility disorders. The nucleic acids are further used as hybridization probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The polypeptides are also useful as vaccines. This sequence represents an example of the forward primer used to amplify a probe to isolate the nucleic acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New NOVX polypeptides and nucleic acid molecules useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis or diabetes, in chromosome mapping, tissue typing or in

The invention relates to a method of preparing a DNA molecule by attaching an adaptor having at least one known sequence and a nonblocked attaching an adaptor having at least one known sequence and a nonblocked 3 and to the ends of the modified DNA fragments to produce adaptor.

Combolocked 3, end of the adaptor, leaving a nick site between the combolocked 3, end of the adaptor, leaving a nick site between the comprises: (a) obtaining at least one DNA molecule; (b) randomly comprises: (a) obtaining at least one DNA fragments; (c) modifying the chase of the DNA fragments to produce DNA fragments; (d) attaching an adaptor having at least one known sequence and a nonblocked 3 end to adaptor having at least one known sequence and a nonblocked 3 end to fragments, where the 5 end of the modified DNA is attached to the comblocked 3 end of the adaptor, leaving a nick site between the comblocked 3 end of the modified DNA is adaptor; (e) extending the adaptor-linked fragments. This sequence corresponds to an of the adaptor-linked fragments. This sequence corresponds to an of the modified DNA from the nick site; and (f) amplifying the coligonucleotide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                       genome, a transcriptome, or both, or a nucleic acid, e.g. DNA or RNA molecule or a DNA molecule generated from at least one mRNA molecule. The method comprises subjecting the DNA molecule/primer mixture or the RNA molecule/primer mixture to a polymerase, under conditions where the subjecting steps generate molecules including all or part of the constant region at each end. The present sequence was used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; hammerhead ribozyme; cytostatic; antitumour; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; virucide; osteopathic; vulnerary; cancer; lymphoma; Ewing's sarcoma; melanoma; psoriasis; tumour and; ogenesis; diabetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris; angiofibroma of tuberous sclerosis; port-wine stain; wound healing; Sturge Weber syndrome; kippel-Trenannay-Weber syndrome; leukaemia; ss; Osler-Weber-rendu syndrome, leukaemia; osteoporosis; DNAzyme; inozyme;

```
The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, the conditions selected from cancer, lymphoma, arthritis, psoriasis, vertuca neovascular glaucoma, myopic degeneration, arthritis, psoriasis, vertuca conditionme, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu (Weber syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of SEG gene, by contacting the cell with (I). (I) is useful for cleaving RNA of cation such as Mg2+. (I) is useful for reducing ERG activity in a cell, by contacting the expression of ERG, and as diagnostic tool to cation such as Mg2+. (I) is useful for diagnostic fool to cation such as Mg2+. (I) is useful for diagnostic tool to cation such as man especifically cation genes that share homology with ERG gene or ERG fusion genes.

CRANINGSA-ABKZ1919 represent nucleic acids, including antisense and carried acides acides including antisense and construction or cation and cation or cation or cation cation or cation or cation or cation cation cation or cation 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzhaimer's disease; achizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                                                                               Novel polynucleotide which down regulates expression of Ets-related genuseful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ABKI7354 ABK22719 represent nucleic acids, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, and related PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to a novel isolated 17 mer nucleic acid sequence, a given in the specification, a sequence containing at least 15 consecutive given in the specification, a sequence with, after optimal anceled alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of hybridizes to them under highly stringent conditions, or the complement of acids of the invention are useful as probes and primers for detecting, identifying and/or amplifying a nucleic acid, e.g. as one identifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for component of a gene chip, in vitro as (anti) sense reagents, and for component of a gene chip, in vitro as (anti) sense reagents, or and for component of the mortalic acids, cells containing the nucleic acids for prevention and/or treatment of viral components of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell components. Analysis of the expression of the 17 mer nucleic acids in degeneration, specifically cancer but also Alzheimer's disease and diseases. The polypeptides can also be used to generate antibodies, and chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequence represents a tumour suppression contacted human fukutin oligonuclectide of the invention
New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to the isolation of 6327 nucleotide sequences, c fragments of at least 15 consecutive nucleotides of these nucleotides, a consecutive nucleotides of these nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, a sequence that hybridizes under stringent conditions with nucleotides, a sequence that hybridizes under stringent conditions with nucleotides, or the complement, or corresponding RNA, of the nucleotides are used as probes or primers for detecting, nucleotides. The nucleotides are used as probes or primers for detecting, identifying and/or amplifying nucleic acids, as in vitro sepse and antisense sequences, of nucleotides involved in tumour c suppression or reversion, apptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as compained in the polypeptides (also vectors containing them and complements). The nucleotides (also vectors containing the vectors), the encoded polypeptides and antibodies colving the vectors), the encoded polypeptides and antibodies or viral infections or diseases characterized by development of tumours or eall degeneration (e.g. Alzheimer's disease or schizophrenia).

Con cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Con and/or prognosis of these diseases characterides can be used to screen for their specific interactive molecules, other their specific interactive molecules, other entially useful for treating diseases associated with abnormal expression of the nucleotides associated with abnormal

                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                    AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyphing studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the pharmaceutical agents are agents and sisease states. When the secting on a disease as well as other treatment.

CC of pharmaceuticals in humans by determining allelic variability of at least two polymorphisms of a human enzyme involved in phase I and/or II CC for the detoxification mechanism in a blood, tissue or other human sample, where tolerance is determined from presence or absence of alleles. The cxit comprises two pairs of oligonucleotide primers, in which each pair of a gene for a human detoxification mechanism—associated enzyme. The kit may also contain two further pairs of oligonucleotides, serving as probes for detection of amplified DNA segments, especially where the probes are complementary to a single trand of one allele of the target gene. The probes are labelled with the fluorophores (LC-Red040 or LC-Red056 for 5'-labelling or fluorescein for 3'-labelling) which generate a different signal in the hybridized and non thypridized condition. The enzymes detected include NAT2, CYP2B1 or DPD. CYP3A4, mEH, TPWT, MTHFR, parcoxonase, CYP2C9, CYP2C19, CYP2B1 or DPD. CYP3A4, mEH, TPWT, MTHFR, parcoxonase, CYP2C9, CYP2C19, CYP2B1 or DPD. CYP3A4, mEH, TPWT, MTHFR, parcoxonase, CYP2C9, CYP2C19, CYP2B1 or DPD. CYP3A4, mEH, is used to determine an individual's tolerance of a particular drug, to establish a suitable dose and/or to predict if a subject will condition of the metabolic capacity of phase I and/or II enzymes at the molecular level. This sequence represents a probe used in the kit of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

motif) cleaves the mRNA of the transforming growth factor-beta (TGF-beta) gene. This sequence corresponds to bases 2447-2465 of the TGF-beta mRNA. The ribozymes can also target the mRNAs of genes associated with the development or maintenance of fibrous or connective tissue disease in order to prevent or treat these diseases. Such genes include TGF-alpha or beta, epidermal growth factor, inhibins, activins, amphiregulin, bone morphogenic proteins, fibroblast growth factors a and b, insulin growth factor 1 or 2, insulin or relaxin.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.

Representative examples of ribozyme recognition sites are given in AAA8215 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine irrolved in confinemation, matrix metalloproteinase (WMP), cyclin, cell-cycle inflammation, matrix metalloproteinase (WMP), cyclin, cell-cycle candenate kinase, growth factor or a reductase, or administering a dependent kinase, growth factor or a reductase, or administering a dependent kinase, growth factor or a reductase, or administering a cholic acid molecule [1]) comprising a promoter operably linked to a nucleic acid molecule [1]). (1) can have antipsoriatic, antibication ophthalmological, cytostatic, antiseborrheic, antidiabetic, antidiabetic, antidiabetic, antidiametion. (1) can be used classases such as propriasis, atopic dermatitis, actinic keratosis, diseases such as postiasis, atopic dermatitis, actinic keratosis, calso be used for treating proliferative eye diseases such as diabetic content and etachment, and for treating and preventing correctinopathy, vitreortinopathy, sickle cell retinopathy, retinopathy of creating such as keloid, adhesion and hypertrophic or hypertrophic burn content and content and for treating and preventing content. AAT50887-T50904 represent oligonucleotides of the invention. These sequences are all probes for interleukin-6 receptor (IL-6R) mRNA. IL-6 is one of the most well characterised of the cytokines. It functions through interacting with at least two transmembrane glycoprotein receptor. Come of the signal transduction by IL-6 involves the angenal transduction by IL-6 involves the concerted action of both IL-6R and gpl30. IL-6 overproduction is implicated in many different disease states, particularly in cellular proliferation associated with these diseases. These sequences bind to the IL-6R coding sequence, thereby inhibiting IL-6R production. The sequences therefore inhibit the functioning of IL-6. These sequences can be used for inhibiting disease-associated cellular proliferation. The oligonucleotides are especially useful for treating cancer (e.g. renal cell carcinoma), autoimmune diseases or viral infections. They can also be used as probes for detecting IL-6 receptor mRNA, especially for contacting the effectiveness of drugs in reducing IL-6 receptor mRNA
                                                                                                                                                                                                                        Probe; interleukin-6 receptor; IL-6R; cytokine; cellular proliferation; transmembrane glycoprotein receptor; signal transducer; gpl30; inhibitor; IL-6; cancer; renal cell carcinoma; autoimmune disease; viral infection;

The intention describes a movel antibody which receptor one crosis factor (TNF)-related apoptosis-inducing ligand (TRAIL) receptor of activity to a cell expressing DRS in vivo. It is also useful for preparing a therapeutic for selective apoptosis of abnormal or disregulated cells, and for inhibiting cell proliferation in a cell, preferably a human breast, ovary, colon, haematopoietic, prostate, lymphatic, lung, glioma or liver cancer cell. A therapeutic agent may also be administered e.g. pacitizes, taxol or cycloheximide. The antibody is used to treat an autoimmune disease, systemic lupus crythematosus. Hashimoto's disease, rheumatoid arthritis, graft-versus-host disease, Sjogram's syndrome, controlmented addison disease, scleroderma, Goodpasture's syndrome, autoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple sclerosis, seterility, myasthenia gravis, multiple sclerosis, mephritis, hypoplastic anaemia, rejection after organ transplantation, and numerous malignancies of lung, prostate, liver, ovary, lymphatic or breast tissue. This primer was used to isolate the mouse TRAIL TRA-8, a ligand of the DRS receptor and the TRAIL on which the humanised antibodies of the invention are based
                                                                                                                                                                                                                                                               Tumour necrosis factor-related apoptosis-inducing ligand receptor; TRAIL;

Antibodies of the invention are useful for selectively inducing apoptosis in target cells expressing DR4, for inhibiting proliferation of target cells expressing DR4 or for treating cancer, inflammatory disease or autoimmune disease in a subject e.g. systemic lupus erythematosus, Hashimoto's disease, rheumatoid arthritis, graft-versus-host disease, Goodpasture's syndrome, Crohn's disease, multiple sclerosis, diabetes mellitus, allergy, asthma, arteriosclerosis or glomerular nephritis. The present sequence is a PCR primer used to clone mouse anti-human DR5 antibody (TRA-8) CDNA
                                                                                                                                                                                                                                             Tumour necrosis factor; TNF-related apoptosis-inducing ligand; allergy; inflammatory disease; TRAIL receptor; systemic lupus erythematosus; DR4; Hashimoto's disease; rheumatoid arthxitis; inflammatory; disease; cancer; multiple sclerosis; graft-versus-host disease; arteriosclerosis; asthma Goodpasture's syndrome; autofimmune disease; glomerular nephritis; DR5; crohn's disease; diabetes mellitus; TRA-8 antibody; mouse; PCR; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New purified antibody that specifically binds a TNF-related apoptosis-
inducing ligand receptor DR4 or DR5, useful for treating cancer,
inflammatory disease or autoimmune disease in a subject, e.g. asthma or

The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide further relates to: an oligonucleotide containing single nucleotide fragments from any one of 1220 fully defined sequences as given in fragments from any one of 1220 fully defined sequences as given in a specification; a labelling probe containing oligo. The isolated human gene. The isolated human gene is also useful for detecting the single nucleotide containing oligo. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polymucleotide sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ss; primer; nephrotropic; antiarteriosclerotic; cardiant; antiasthmatic; antiallergic; antiinflammatory; antidiabetic; haemostatic; neuroprotective; antiinfertility; immunosuppressive; dermatological; antianaemic; antirheumatic; antiarthritic; thyromimetic; apoptosis;

```
The invention relates to a method of selectively inducing apoptosis in and inhibiting (M1) proliferation of target cells expressing DRS, comprising contacting the cell with an antibody that specifically binds tumor necrosis factor (TMP)-related apoptosis-inducing ligand (TMALL) receptor DRS, where the antibody, in its soluble form, has in vivo and in vitro apoptosis-inducing activity in the cell expressing DRS, and contacting the cell with one or more therapeutic agents. M1 is useful for inducing apoptosis in target cell and inhibiting proliferation of target cell expressing DRS, where the target cell is an abnormally proliferating synovial cells (e.g. rheumatoid arthritis synovial cell), activated immune cell (e.g. activated lymphocyte), neutrophil, or virally infected immune cell (e.g. activated lymphocyte), neutrophil, or virally infected cell. maximated lighamatory or autoimmune diseases. The inflammatory or autoimmune disease are selected from systemic lupus erythematosus, Hashimoto's disease, rheumatoid arthritis, graft-versus-host disease, Sjogren's syndrome, Crohn's carchitis, graft-versus-host disease, Sjogren's syndrome, Crohn's carchitises, allergy, carchitals apprintis, and hypoplastic anemia, Addison disease, arteriosclerosis, myocarditis, cardiomyopathy, continual applitis, and hypoplastic anemia. This sequence represents a privare and an arteriosclerosis, myocarditis, cardiomyopathy, continual and propersis and hypoplastic anemia. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inducing apoptosis and inhibiting proliferation of target cells expressing DRS, by contacting the target cell with an antibody that binds TNF-related apoptosis-inducing ligand receptor DRS and with therapeutic

New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                                                                                                                     /note= "This oligonucleotide has a phosphorothioate backbone and 2-'methyoxyethyl (2. MDB) wings at the 5' and 3' ends, which are 4 nucleotides in length. Also all cytidine residues are 5-methylcytidines"
                                                                       Antilipaemic, Cardiovascular, Analgesic, Antianginal, Antisense therapy, Human, Endothelial Lipase, dyslipidaemia, high density lipoprotein, HDL; cardiovascular disorder, metabolic syndrome X, ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotetin (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                 Human endothelial lipase antisense oligonucleotide, SEQ ID 3694.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to antisense oligonuclectides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonuclectide specifically hybridises with and inhibits the expression of EL. The antisense oligonuclectides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                   /mod_base= OTHER
/mote= "This oligonucleotide has a phosphorothioate
/note= "This oligonucleotide (2'-MOE) wings at the 5'
backbone and 2'-methyoxyethyl (2'-MOE) wings at the 5'
backbone and 3'-methy witch are 4 nucleotides in length. Also all
aridine residues are 5-methyloytidines"

The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonuclectides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, eardiovascular or neurological disorder, ischemia/repertusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothioate oligonuclectide with 2'-MOE wings and a deoxy gap, these diagnostics in the research and man are also services of the second se
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New compounds, particularly antisense oligomucleotides targeted to a nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase (GFAI), for treating diabetes, a cardiovascular or neurologic disorder, ischemia/reperfusion injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GFAT; Antidiabetic; Cardiant;
Glutamine-fructose-6-phosphate amidotransferase; diabetes; ischemia;

The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonucleotides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition. They are also useful in research and disgnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2' MOE wings and a deoxy gap, these oligonucleotides inhibit human GFAT expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase (GPAT), for treating diabetes, a cardiovascular or neurologic disorder, ischemia/reperfusion injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GFAT; Antidiabetic; Cardiant;
Glutamine-fructose-6-phosphate amidotransferase; diabetes; ischemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 20 BP; 4 A; 2 C; 5 G; 9 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a compound which specifically hybridizes with a mucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligomuclectides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligomucleotide with 2. MOE wings and a deoxy gap, these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New compounds, particularly antisense oligonucleotides targeted to a nuclaic acid encoding glutamine-fructose-6-phosphate amidotransferase (NGRI), for treating diabetes, a cardiovascular or neurologic disorder, ischemia/reperfusion injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                         The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonuclectides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligonuclectide with 2'-MOE wings and a deoxy gap, these oligonuclectides inhibit human GFAT expression.
                                                                                                                                                                    New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase (GFAT), for treating diabetes, a cardiovascular or neurologic disorder, ischemia/reperfusion injury.
                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                 The invention relates to a recombinant dimethyl sulphide (DMS):acceptor oxidoreductase (I) or its subunit selected from recombinant alpha, beta, delta and gamma subunits. (I) is useful for oxidising prochiral organic sulphides to form sulphoxide enantiomers for chiral drug synthesis. (I) is expressed in a transformed bacterium. The enantiomer formed is useful for producing a chiral drug. (I) is useful for synthesis of optically-active functional groups of drug. DNA encoding (I) is useful for producing a strain of DMS:acceptor oxidoreductase-deficient Rhodovulum sulfidophilum, which is useful in whole-cell reaction, where DMS:acceptor oxidoreductase activity is unwanted. ABK53751-ABK53805 represent R. sulfidophilum DMS:acceptor oxidoreductase subunit coding sequences and PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.
                                                                                                 New recombinant dimethyl sulfide:acceptor oxidoreductase or its subunits, useful for oxidizing prochiral organic sulfides to form sulfoxide enantiomers for chiral drug synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1.4%; Score 15.4; DB 1; Length 21; 94.1%; Pred. ö
pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see ANY14584- AAV15879) can be used in immunogenic compositions as voccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense compounds which specifically hybridize with and inhibit human methionine aminopeptidase 2 expression, useful for treating methionine aminopeptidase 2 related disorders and preventing inflammation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Methionine aminopeptidase 2 (also known as MetAP2 and eukaryotic initiation factor [eIF-2] associated protein, p67) is a cellular glycopyrotein that promotes protein synthesis in the presence of active eIF-2 kinases by protecting the eIF-2 alpha subunit from phosphorylation. The present invention relates to antisense oligonucleotides (AACG7690-C67767) which inhibit human methionine aminopeptidase 2 coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    expression (see AAC67683). The present sequence is one such antisense oligonucleotide. The present sequence may be used for treating a patient suspected of having or being prone to a disease or condition associated with expression of MetAP2. In addition, the present sequence can also be used as research reagents, diagnostics and to distinguish between functions of various members of a biological pathway. The antisense oligonucleotide may further be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. Note: the present sequence may have a phosphorothioate backbone and 2-methoxyethyl (2'-MOE)
                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                            Score 15.2; DB 1; Length 20;

ITS DNA sequences from M. fortuitum, M. chelonae, M. abscesus, M. vaccaé, M. Ilavescens, M. asiaticum, M. porchium, M. capulcensis, M. diernhoferi genes were identified. The oligonucleotides derived from these sequences were used to develop PCR primers and hybridisation probes for detection and identification of Mycobacterium. ITS has a more polymorphic region than 16S rRNA and also has a conserved region. It is therefore highly effective as a target DNA for distinction of genotype. The oligonucleotide probes, attached to solid substrate, hybridise only with nucleotide sequences in ITS of specific mycobacteria, and thus they can detect and identify the specific mycobacteria sensitively. The oligonucleotides can also detect and identify the specific mycobacteria by PCR amplification. Using the oligonucleotide primers or probes made
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel oligonucleotide sequences of internal transcribing spacer region of non-tuberculosis mycobacteria (NTM) used as probes or primers for detecting and identifying mycobacteria and distinguish TB complex from

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to compounds and methods for inhibiting histone deacetylase (HDAC) enzymatic activity. Compounds of the invention are used for the treatment of cell proliferative diseases and conditions such as cancer, restencists or psoriasis. They are also used for treating or preventing protozoal or fungal disease or infections. The present sequence is antisense oligonucleotide, HDAC8 AS2 which is targetted to the 3' untranslated region (UTR) of human HDAC8 to inhibit its enzymatic

This invention relates to a mouse containing the human cytochrome P450 gene (from the CYP3A family). PCR primers AAF92356 - AAF9241 are used in examples illustrating the construction of vectors used in the production of the transgenic mouse of the invention. The mouse can be used for studying human drug efficacy, metabolism and toxicity, including the application of immortalised cell and tissue cultures

                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                             Inhibition of HDAC-4 activity in a cell useful for treating e.g. cancer involves contacting the cell with an antisense oligonucleotide or a small molecule inhibitor of HDAC-4.
                                                                                                                                                            The invention relates to inhibition of histone deacetylase (HDAC)-4 activity in a cell that involves contacting the cell with an antisense oligonucleotide complementary to a region of RNA encoding a portion of HDAC-4 or a small molecule inhibitor of HDAC-4. The method is useful for inhibiting neoplastic cell proliferation in an animal (preferably human) and for treating cancer. Sequences ABV73073-3091 represent HDAC isotype-

Confecting infectious diseases caused by bacterial infectious agents e.g. Salmonellar, Listeria emonocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida abbicans and infectious agents e.g. Cryptococcus neoformans, Candida abbicans and Case infectious agents e.g. Cryptococcus neoformans, Candida abbicans and Descriptions of Special Darr virus and pollo virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such case 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe gressence or absence of the target nucleotide sequences. ```
The invention relates to an agent that inhibits an isoform of histone deacetylase (HDAC-1 to HDAC-8) but not all isoforms, e.g. an antisense deacetylase (HDAC-1 to HDAC-8) but not all isoforms, e.g. an antisense oligonucleotide. Also included are inhibiting an HDAC isoform in a cell for induction of cell proliferation or differentiation and inhibiting for induction of cell proliferation or differentiation and inhibiting cell proliferation by treatment with two antisense oligonucleotides or small molecules that inhibit a specific HDAC isoform, or antisense oligonucleotide or small molecules that inhibit DNA methyltransferase. The agent therefore acts as a tumour suppressor. The agents are used to treat diseases of cell proliferation and differentiation (e.g cancer and tumours), by inducing growth retardation, growth arrest or tumours), by inducing growth retardation, growth arrest or programmed/necrotic cell death, specifically neoplastic cell proliferation in humans. The agents are selective for particular isoforms, compared to known inhibitors which are not selective. The present sequence is an antisense oligonucleotide of the invention targeting the polynucleotide which encodes the HDAC-8 isoform
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; alphainterferon-21; cancer; leukaemia; cardiovascular disease; metabolic disease; infection; hepatitis B; hepatitis C; AIDS; depression; associated Kaposi sarcoma; pneumonia; ulcerative colitis; osteoporosis; central nervous system disease; schizophrenia; Alzheimer; disease; parkinson's disease; graft rejection; wound; anaemia; allergy; asthma; multiple sclerosis; psoriasis; rheumatoid arthritis; Crohn's disease; autoimmune disorder; gastro-intestinal disease; chemotherapy; cytostatic; anorectic; viruóde; anti-HIV; antiinflammatory; hepatotropic; antiulcer; antiallergic; antiaschmatic; neuroprotective; osteopathic; antipsoriatic; antiarthritic; antirheumatic; dermatological; antiemetic; antidepressant;

```
The present invention relates to human alphainterferon-21. The coding sequence (see ABV/4504) for this protein can contain at least one of the collowing single nucleotide polymorphisms (SNP): C9734, G1011C, T10494, C1011c, T10494, G1011c, G1041c, G1041c,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; histone deacetylase; isoform; HDAC-1; HDAC-2; HDAC-3; HDAC-4;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 117
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an antisense oligonucleotide comprising a nucleotide sequence of 13 to 15 nucleotides that inhibits one or more nucleotide sequence of 13 to 15 nucleotides that inhibits one or more specific histone deacetylase isoforms (HDA-1 to HDAC-8), where the oligonucleotide is useful in inhibiting one or more histone deacetylases isoforms in a cell comprising contacting the cell with the oligonucleotide. Cell proliferation is inhibited in the contacted cell which undergoes programmed and necrotic cell death. The oligonucleotide is also useful in inhibiting neoplastic cell proliferation in an animal, to preferably a human. The oligonucleotide is also useful in identifying a histone deacetylase isoform that is required for the induction of cell proliferation. The above method is also applicable to identifying indicates that the isoform is required for the induction of cell conditions to indicate that the isoform is required for the induction of cell in identifying an isoform required for the induction of cell in identifying an isoform required for the induction of cell in identifying an isoform required for the induction of cell in identifying an isoform required for the induction of cell conditions. Where an induction of cell differentiation indicates that the isoform is required for the induction of cell conditions. The present sequence condition is required for differentiation indicates that the isoform is required for differentiation indicates containing an an antisense oligonucleotide directed against an HDAC isoform containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                            New antisense oligonucleotide that inhibits one or more specific histone deacetylase isoforms, is useful in modulating cell proliferation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fluorescent protein; label; protein function; protein distribution; fungal; PCR; primer; 88; 5'RACE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     5'-RACE primer for amplifying fluorescent protein cDNA #SEQ ID 18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ·;

```
The invention relates to 4 fluorescent proteins originating from Fungia species. Also disclosed are DNA sequences encoding the novel fluorescent proteins, expression vectors containing this DNA, hosts transformed by this vector, fluorescent fusion proteins containing the novel fluorescent proteins fused to another protein, and a method for analysis of function and distribution of another protein using the fluorescent fusion protein. Novel proteins of the invention are useful for analysis of the intracellular activity, function and localisation of proteins of biological interest, using the fluorescent protein as a fluorescence properties and a low sensitivity to pH. The current sequence represents a 5'-RACE (rapid amplification of cDNA ends) primer used to recover fungal fluorescent protein terminal sequence from extracted cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                     Fluorescent proteins from Fungia species and DNA encoding them for analysis of function and distribution of proteins in living systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HDAC; histone deacetylase; cytostatic; vasotropic; antipsoriatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to antisense compounds targeted to a nucleic acid encoding interleukin-1 (IL-1) receptor-associated kinase-1 (IRAK-1). The antisense compound comprises an antisense oligonuclectide that specifically hybridises with the nucleic acid and inhibits the expression of IRAK-1. The antisense oligonuclectide is a chimeric oligonuclectide. The antisense oligonuclectide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage.
                                                 New histone deacetylase inhibitors, useful for treatment of proliferative diseases or conditions e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New compound having a sequence targeted to a nucleic acid encoding IL-1 receptor-associated kinase-1, useful for preparing a composition for treating hyperproliferative or autoimmune disorder or inflammation.
                                                                                                                            Hormine and their salts. The compounds inhibit histone deactvlase (HDAC) enzymatic activity. They can be used for treating cell proliferative diseases or condition (e.g. cancer, restenosis and psoriasis). Sequences AB276476-492 represent antisense and mismatch oligonucleotides targeting the 5'- UTR (untranslated region) and 3'-UTRs of the human HDAC1-8 genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense therapy; human; interleukin-1 receptor-associated kinase-1; IL-1 receptor-associated kinase-1; IRAK-1; hyperproliferative disorder e.g.; cancer; autoimmune disorder; alterative disorder inflammation; cytostatic; immunosuppressive; osteopathic; antiinflammatory; ds.

It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl (2'-MOB) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotides are useful for the treatment of diseases such as hyperproliferative disorders, e.g. cancer, autoimmune disorders, altered bone metabolism, and inflammation. The present sequence represents a human IRAK-1 DNA target sequence for an
                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to antisense compounds targeted to a nucleic acid encoding interleukin-1 (IL-1) receptor-associated kinase-1 (IRAK-1). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of IRAK-1. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense therapy; human; interleukin-1 receptor-associated kinase-1; IL-1 receptor-associated kinase-1; IRAK-1; hyperproliferative disorder e.g.; cancer; autoimmune disorder; altered bone metabolism or inflammation; cytostatic; immunosuppressive; osteopathic; antiinflammatory; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /mod_base= OTHER
/mod_base= This oligonucleotide has a phosphorothioate
/note= This oligonucleotide has a the 5'
backbone and 2'-methyoxyethyl (2'-MOE) wings at the 5'
and 3' ends, which are 5 nucleotides in length at each
end. All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New compound having a sequence targeted to a nucleic acid encoding II receptor-associated kinase-1, useful for preparing a composition for treating hyperproliferative or autoimmune disorder or inflammation.

ö
modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoyathyl (2'-MOE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotides are useful for the treatment of diseases such as hyperproliferative disorders, e.g. cancer, autoimmune disorders, altered bone metabolism, and inflammation. The present sequence represents an antisense oligonucleotide used in the examples of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 cytostatic; endocrine; hepatoma-derived growth factor inhibitor; hepatoma-derived growth factor; metabolic disorder; hyperproliferative; human; ss; antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /mod_base= OTHER

The invention describes a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding hepatoma-derived growth factor, and inhibits the expression of hepatoma-derived growth factor. The compound, composition and methods are useful for treating a disease or condition associated with hepatoma-derived growth factor, such as a metabolic disorder, or hyperproliferative disorder, e.g. cancer, which is selected from hepatoma, leiomyoma, esophageal cancer or ovarian cancer. They are also useful in research and diagnostics for modulating the expression of hepatoma-derived growth factor. This sequence represents a human hepatoma-derived growth factor antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cytostatic; endocrine; hepatoma-derived growth factor inhibitor; hepatoma-derived growth factor; metabolic disorder; hyperproliferative; human; ss; antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Phosphorothioate backbone. All cytidines

888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to inhibiting neoplastic cell proliferation in an animal by administering to the animal having at least one neoplastic cell present in its body: an antisense oligonucleotide complementary to a region of RNA that encodes a portion of histone deacetylase-7 (HDAC-7) or HDAC-8; and/or a small molecule inhibitor of HDAC-7 or HDAC-8. Inhibition of HDAC-7 or HDAC-8 activity in the contacted cell further leads to an inhibition of cell proliferation, growth retardation and to necrocic cell acath, growth arrest, or programmed cell death of the contacted cell. The method is useful for inhibiting neoplastic cell proliferation in an animal, preferably human. The method further comprises administering an antisense oligonucleotide complementary to a region of RNA that encodes a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inhibiting neoplastic cell proliferation in animals by administering an antisense oligonuclectide complementary to region of RNA encoding portion of histone deacetylase-7 (HDAC-7) or HDAC-8, or small molecule inhibitor of HDAC-7 or HDAC-8.
                                                                                                                                                                                                                                                                                                                                                                                ö
                                   The invention describes a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding hepatoma-derived growth factor, and inhibits the expression of useful for treating a disease or condition associated with hepatoma-derived growth factor. The compound, composition and methods are hyperproliferative disease or condition associated with hepatoma-hyperproliferative disorder, e.g. cancer, which is selected from hyperproliferative disorders, e.g. cancer, which is selected from useful in research and diagnostics for modulating the expression of hepatoma-derived growth factor. This sequence represents a human hepatoma-derived growth factor. This sequence represents a human hepatoma-derived growth factor antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                ;
